BigWords iPhone App
This is a simple iPhone application, and should not take longer than eight hours to create.

The premise is also simple: you type a message on the iPhone keyboard, and whatever you type is displayed on the iPhone screen in white text with a black background.

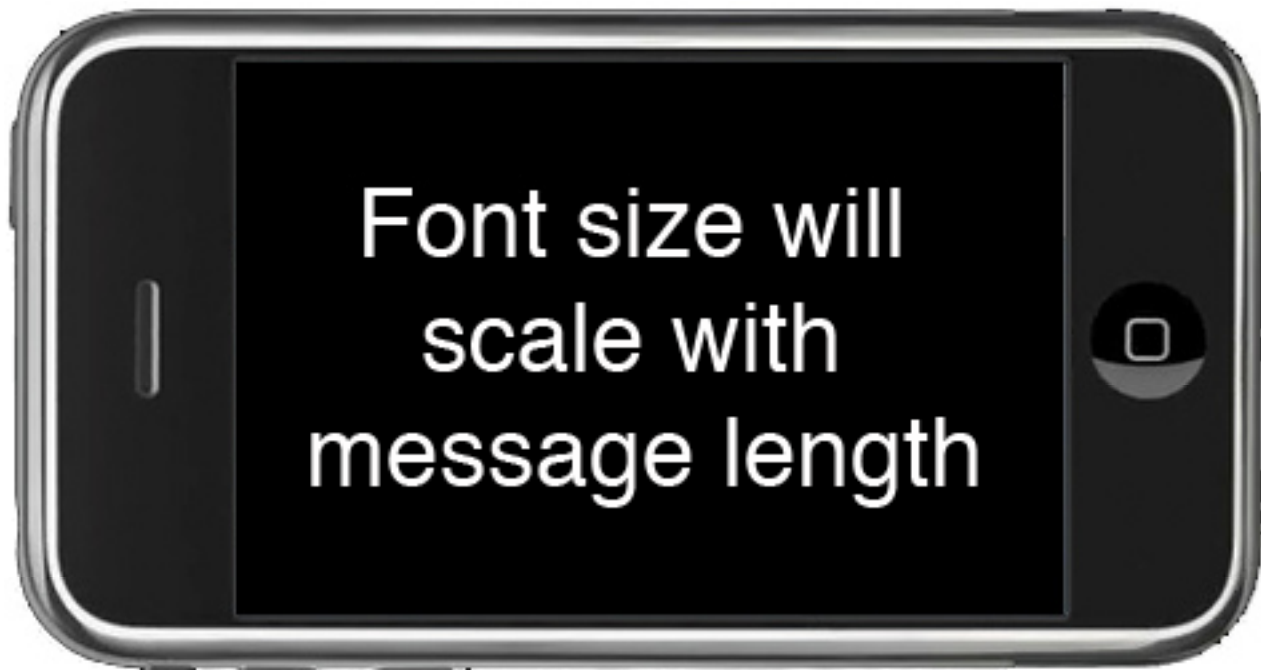

Text Input Portrait

Text Input Landscape

The text message should take up most of the screen for easy reading from across a room.

Hello!

Font size will scale with message length

When you type the message, in either landscape or portrait mode, the text enter screen will look normal. (i.e., black text on white background, similar to an email message text input display)

There should be a "Go" or "OK" button to click once the message has been typed and the user is ready to display the message.

Once the button is pushed, the keyboard will go away, the screen will go black, and the message will appear in the largest possible type size in white on the screen.

The message should only appear in landscape mode.

Shaking the iPhone will erase the message and return the user to the text input screen with keyboard.

Wish-list features, only added if in the budget
Five "saved" buttons, which allow the user to type in a message, and hold one of the "saved" message buttons for three seconds. This will save said message at that present button to be used later, so the user can display the same message anytime without the need to retype.
